

PORT OF HAY POINT

Port of Hay Point Phase 2 and Phase 3 (2023-2024).

NQBP selected PaCE to prepare sampling designs and secure regulator approvals prior to implementation of field investigations for both Phase 2 and Phase 3 sediment survey. PaCE completed the field survey over a 25 day period and coordinated access at active shipping berths with coal terminal operators and the vessel traffic management service. Works were completed safely from over 160 sampling locations using both benthic grabs and vibrocore systems providing cores up to 3m in length. Full physical and chemical assessment was undertaken according to the National Assessment Guidelines for Dredging and included additional detailed sampling at the berth pockets to allow for Phase 3 bioavailability testing .
